ASTRALPOOL

RO9 Automatic Control System

The RolaChem 9 series provides ongoing sanitiser management of your pool or spa so that it always looks great and is safe and healthy to swim in. With sophisticated sensors and software programming the sanitiser level is continuously monitored and adjusted according to your swimming pool or spa's requirements, weather conditions or bather load. All while dramatically reducing the maintenance required for your pool and spa.

The RO9 provides the function of advanced measure and control of your sanitiser activity which means lower usage of sanitiser, saving you money. By constantly measuring and dosing sanitiser to maintain the correct set point, the RO9 controller ensures the sanitiser in your water is at its optimal level.
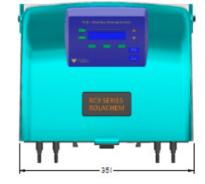

A sanitiser sensor with inbuilt amplifiers detects tiny signals in the pool water representing the effective sanitiser level. These signals are transferred to the controller which interprets the readings. The sophisticated software then activates small chemical pumps to accurately dose the correct sanitiser amounts which results in perfectly sanitised pool and spa water. The RolaChem dosing pumps are proportionally controlled – the more sanitiser required, the longer they operate. The less required, the shorter they operate so that levels are intelligently controlled.
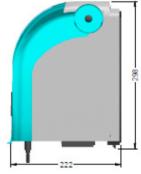

The RO9 can automatically control your filter pump operating hours with its inbuilt timeclock and the "Spa" button changes the dosing rate to suit the smaller volume of your spa when isolated from the pool.

The RolaChem RO9 series controller is covered by a one year warranty on all components.
